C loops

Write a program that asks for a positive integer n and builds a *triangle* like so:

```
What is n? 4
*
**
***
****
```

What about writing a function and calling it multiple times? Can you do this with nested `for` loops?

Area of above right triangle

Given the previous problem, you can now build a right triangle. Assuming the legs of the triangle are the same, find the hypotenuse. Use [this page](#) web page to only print out **two digits** of precision (search for precision).

Factorial

Recall that the factorial of a number n , $n!$ is $n * n-1 * n-2 \dots * 2 * 1$. Write a program (using `long` and not `int`) that asks for a positive integer and computes its factorial. Run it on larger and larger numbers. Does it take a long time? Is there any way to speed this computation up? (Hint: try saving the result of the computations in memory)
